

Grok Bot vs. OIKONOMOS — Feature Comparison

Basileia Technologies · OIKONOMOS Platform Synthesis · 13 August 2026

■ **Built** running today on Basileia infrastructure ■ **Designed** specified in detail, not yet implemented ■ **Partial** engine exists, integration point missing ■ **Gap** no current equivalent

Feature-by-feature mapping

Grok Bot feature	OIKONOMOS equivalent	Status	Note
Own dedicated cloud/VM instance	clawsrv (Tailscale, PM2) today; Docker-isolated per-agent workspace at Phase 3	Built	Shared host now; per-agent isolation designed
Signs into existing tools/apps, operates like a human	MCP connectors (Phase 1, Gmail only) + Playwright browser workspace (Phase 3)	Gap	Grok Bot ships 25+ connectors day one; OIKONOMOS has zero live
Works without clean APIs, controls real UI	Browser workspace + noVNC	Designed	Phase 3, weeks out
Multi-step task completion end-to-end	AgentProvider → Claude Code harness	Partial	Engine built; not wired to broker/approvals
Works 24/7, laptop closed	clawsrv + PM2	Built	—
Returns with finished work, or asks for a decision	Telegram approval flow, risk tiers	Designed	Not implemented
"Show once, learns a routine"	Hermes-pattern skill curation + routine extraction	Designed	Phase 4 — furthest-out item in the roadmap
Memory: work style, preferences, account nuances, improves over time	profile_facts table, pgvector, Hermes memory patterns	Designed	Schema only; Grok Bot claims this live now
Multi-Bot teams, coordination, delegation	Typed handoffs over pg-boss	Designed	Phase 4
Approval-focused, only interrupts when needed	Risk tiers 0-4, nonce-bound approvals, one-time consumption	Designed (deep)	More rigorous than Grok Bot's published model — cryptographic action binding, replay-proof, append-only audit
Desktop app + iOS access	Telegram gateway (existing bot)	Built	Different surface, functionally equivalent reach
Cross-Bot shared context	—	Gap	No equivalent designed yet

Reading the balance

On **governance** — approval binding, audit, risk tiering, tenant isolation — the OIKONOMOS design is more rigorous than anything Grok Bot has published: cryptographically bound, replay-proof, one-time-use approvals and an append-only audit trail go beyond a simple "ask before consequential actions" model.

On **coverage** — connectors, live browser control, memory that actually persists, learned routines — OIKONOMOS is almost entirely at spec-only stage, while Grok Bot is a shipped (if rough) public beta doing all of it today. Phase 1 of the roadmap delivers one Gmail-draft-only role; Grok Bot's beta already claims sales outbound, support queues, CRM hygiene, and inbox triage running unattended.

The current roadmap closes this gap in roughly eight weeks by design, sequencing safety (broker, approvals, audit) ahead of surface area (connectors, browser workspace, memory). If breadth parity matters more than governance rigor in the near term, the fastest lever is pulling Phase 3 (browser workspace) and connector breadth forward — worth flagging since the sequencing was a deliberate choice, not the only option.
